## Kennedy/Jenks Consultants

Client: City of Phoenix

*Pervious Concrete Pavement –*

Residents in an older neighborhood suffered from flooding whenever it rained because their homes were lower than street level.

Kennedy/Jenks Consultants designed a unique, low-impact development solution for stormwater drainage problems that uses pervious concrete to replace conventional paving materials. The pervious concrete controls flooding, removes pollutants from the stormwater, and increases groundwater recharge. Plus, it reduces the urban heat island effect. Great job, Kennedy/Jenks and a great contribution to sustainability!
